🕖 Summary

Stability of linear time invariant dynamical system at equilibrium point depends of the location of the system eigenvalues:

For a continous case a solution is known tobe $x(t) = \exp(tA)x(0)$, so the "deviation" from the equilibria is goverend by the amplification envelope

$$\phi_A(t) := \|e^{tA}\|_p = \sup_{x(0) \neq 0} \frac{\|x(t)\|_p}{\|x(0)\|_p}, \ t \ge 0$$

where $\|\cdot\|_{p}$ is a matrix norm induced by the vector norm $\|\cdot\|_{p}$.

4 / 55

30

Stability of Dynamical Systems

Properties of the amplification envelope:

• return time and norm-invariant r.t.:

$$t_A^{RT} = \min\left\{t > 0: \phi_A(t) \le e^{-1}
ight\}, \ t_A^{NIRT}$$

resilience:

$$\rho_A = \left[t_A^{NIRT} \right]^{-1}$$

• reactivity:

$$\left. \frac{d^+}{dt} \left[\phi_A(t) \right] \right|_{t=0}$$

 $= \max \phi_A(t)$

maximal amplification

イロト 不得 ト イヨト イヨト ニヨー ろんで

Certain matrix characteristics can explain properties of the $\phi_A(t)$, and thus explain global properties of linear system or local properties of a nonlinear one:

- resilience \implies matrix eigenvalues, i.e. matrix spectrum
- transient behavior \implies matrix pseudospectrum
- reactivity \implies logarithmic matrix norm (matrix measure)

Commonly, to derive stability, eigenvalues are being used, since they provide answers to (local) asymptotic stability!

But, often "real" stability is not the same as mathematical asymptotic stability, and to that end using eigenvalues only can be misleading!

Stability via matrix characteristics - resilience

Resilience and return time

Let $A \in \mathbb{R}^{n,n}$ and $x(0) \in \mathbb{R}$ be arbitrary matrix and arbitrary vector. Then for every component $x_i(t)$, $1 \le i \le n$, of trajectory x(t) of LTIDS

$$\dot{x}(t) = Ax(t)$$

 $\lim_{t\to\infty} x_i(t) = 0$ holds if and only if every eigenvalue λ of the matrix A is in the open left half-plane of \mathbb{C} , i.e., $Re(\lambda) < 0$. Therefore, $x^* = 0$ is an (exponentially) stable equilibrium of LTIDS if and only if its spectral abscissa

$$\alpha_{\mathcal{A}} := \max\{Re(\lambda) : \lambda \in \Lambda(\mathcal{A})\}$$

is negative. Moreover, the resilience of such a system is $\rho_A = -\alpha_A$, and norm-invariant return time is $t_{NIRT} = -\alpha_A^{-1}$.

When the eigenvalues are misleading?!

When the eigenvalues are misleading?!

We know that eigenvalues are sensitive to perturbation of matrix entries. The question is how sensitive?!

When the eigenvalues are misleading?!

We know that eigenvalues are sensitive to perturbation of matrix entries. The question is how sensitive?!

Trefeten L. N., Embree M.,: Spectra and Pseudospectra: The Behavior of Nonnormal Matrices and Operators, Princeton University Press, 2005

Let $\varepsilon > 0$. The ε -pseudospectrum of a matrix A is

$$\Lambda_{\varepsilon}(A) = \bigcup_{\|\Delta\| \leq \varepsilon} \Lambda(A + \Delta) = \{ z \in \mathbb{C} \, : \, \|(zI - A)^{-1}\|^{-1} \leq \varepsilon \}$$

Therefore, ε -pseudospectrum is used to establish spectral properties that are *robust* under matrix perturbations bounded in a given norm by the parameter $\varepsilon > 0$.

イロト 不得下 イヨト イヨト 二日

When the eigenvalues are misleading?!

We know that eigenvalues are sensitive to perturbation of matrix entries. The question is how sensitive?!

Trefeten L. N., Embree M.,: Spectra and Pseudospectra: The Behavior of Nonnormal Matrices and Operators, Princeton University Press, 2005

Let $\varepsilon > 0$. The ε -pseudospectrum of a matrix A is

$$\Lambda_{\varepsilon}(A) = \bigcup_{\|\Delta\| \leq \varepsilon} \Lambda(A + \Delta) = \{z \in \mathbb{C} \, : \, \|(zI - A)^{-1}\|^{-1} \leq \varepsilon\}$$

Therefore, ε -pseudospectrum is used to establish spectral properties that are *robust* under matrix perturbations bounded in a given norm by the parameter $\varepsilon > 0$.

It is known that when matrix A is nonnormal, i.e. $AA^* \neq A^*A$, euclidean $\Lambda_{\varepsilon}(A)$ can be very far from $\Lambda(A) + \{z \in \mathbb{C} : |z| \le \varepsilon\}$!

Maximal amplification

Let $A \in \mathbb{R}^{n,n}$ and $x(0) \in \mathbb{R}$ be arbitrary matrix and arbitrary vector, and $\|\cdot\|$ given matrix norm induced by a vector norm. If

$$\mathcal{K}(A) := \sup_{Re(z)>0} \frac{Re(z)}{\|(zI-A)^{-1}\|^{-1}} = \sup_{\varepsilon>0} \frac{\alpha_A^{\varepsilon}}{\varepsilon} < \infty,$$

where

$$\alpha^{\varepsilon}_{A} := \max\{\operatorname{\mathit{Re}}(z) \ : \ z \in \Lambda_{\varepsilon}(A)\},$$

denotes ε -pseudospectral abscissa of A, then $x^* = 0$ is exponentially stable equilibrium of LTIDS and

$$\mathcal{K}(A) \leq \phi_A^{\max} = \sup_{t \geq 0} \|e^{At}\| \leq en\mathcal{K}(A).$$

< ロト < 同ト < ヨト < ヨ

20.10.2019

9 / 55

The value $\mathcal{K}(A)$ is called the Kreiss constant.

$$\nu_{A} = \frac{d^{+}}{dt} \left[\phi_{A}(t) \right] \bigg|_{t=0} = \nu_{A} = \lim_{t \searrow 0} \frac{\|e^{At}\| - \|e^{A \cdot 0}\|}{t} = \lim_{t \searrow 0} \frac{\|E + tA\| - 1}{t}.$$

$$\nu_{A} = \frac{d^{+}}{dt} \left[\phi_{A}(t) \right] \bigg|_{t=0} = \nu_{A} = \lim_{t \searrow 0} \frac{\|e^{At}\| - \|e^{A \cdot 0}\|}{t} = \lim_{t \searrow 0} \frac{\|E + tA\| - 1}{t}$$

Matrix measure for max norm

If $\|\cdot\|=\|\cdot\|_\infty,$ the reactivity of A is

$$u_{\mathcal{A}} = \max_{k} \left\{ \operatorname{Re}(a_{kk}) + \sum_{j \neq k} |a_{kj}| \right\},$$

or, equivalently, reactivity is the Geršgorin abscissa

$$\nu_A = \gamma_A := \max\{Re(z) : z \in \Gamma(A)\},\$$

bearing in mind that the set

$$\Gamma(A) := igcup_{i \in N} \left\{ z \in \mathbb{C} \, : \, |z - a_{i,i}| \leq \sum_{j \neq i} |a_{ij}|
ight\}$$

$$\nu_{A} = \frac{d^{+}}{dt} \left[\phi_{A}(t) \right] \bigg|_{t=0} = \nu_{A} = \lim_{t \searrow 0} \frac{\|e^{At}\| - \|e^{A \cdot 0}\|}{t} = \lim_{t \searrow 0} \frac{\|E + tA\| - 1}{t}$$

Matrix measure for norm 1

If $\|\cdot\|=\|\cdot\|_\infty,$ the reactivity of A is

$$u_{\mathcal{A}} = \max_{k} \left\{ \operatorname{\textit{Re}}(a_{kk}) + \sum_{j \neq k} |a_{jk}| \right\},$$

or, equivalently, reactivity is the column-wise Geršgorin abscissa

$$u_A = \gamma_A := \max\{Re(z) : z \in \Gamma(A^T)\},$$

bearing in mind that the set

$$\Gamma(A):=igcup_{i\in N}\left\{z\in \mathbb{C}\,:\, |z-a_{i,i}|\leq \sum_{j
eq i}|a_{ji}|
ight\}$$

$$\nu_{A} = \frac{d^{+}}{dt} \left[\phi_{A}(t) \right] \bigg|_{t=0} = \nu_{A} = \lim_{t \searrow 0} \frac{\|e^{At}\| - \|e^{A \cdot 0}\|}{t} = \lim_{t \searrow 0} \frac{\|E + tA\| - 1}{t}$$

Matrix measure for euclidean norm

If $\|\cdot\| = \|\cdot\|_{\infty}$, the reactivity of A is the spectral abscissa of the Hermitian part of the matrix A

$$u_A = lpha_{H_A} = \max\left\{\lambda \ : \ \lambda \in \Lambda\left(rac{A+A^*}{2}
ight)
ight\},$$

or, equivalently, reactivity is the numerical abscissa

$$\nu_A = \omega_A := \max\{Re(z) : z \in W(A)\},\$$

bearing in mind that the set

$$W(A) = \left\{ \frac{x^*Ax}{x^*x} : x \in \mathbb{C}^n, \ x \neq 0 \right\}$$

is known as the numerical range.

Stability via matrix characteristics - summary

One can determine the properties of equilibrium $x^* = 0$ of LTIDS by checking the position of an adequate set in \mathbb{C}^- which is quantified by it's abscissa

Property of LTIDS with A	set	abscissa
exponential stability	spectrum $\Lambda(A)$	α_A
arepsilon-robust exponential stability	$\varepsilon-pseudospectrum\ \Lambda_{arepsilon}(A)$	α^{ε}_{A}
non-reactivity in max norm	Geršgorin set $\Gamma(A)$	γ_A
non-reactivity in norm 1	column-wise Geršgorin set $\Gamma(A^T)$	γ_{A^T}
non-reactivity in Euclidean norm	numerical range $W(A)$	WA

In addition, the transient behavior in a given norm can be explained by checking the propagation of the corresponding ε -pseudospectrum in the right half-plane of \mathbb{C} which is quantified by the Kreiss constants.

Non-standard notions of "stability"

Not only that the system needs to be c-stabil, but, additional constraints that depend the imaginary parts of eigenvalues (frequency of the oscillations of the basic solutions) have to hold:

Non-standard notions of "stability"

Not only that the system needs to be c-stabil, but, additional constraints that depend the imaginary parts of eigenvalues (frequency of the oscillations of the basic solutions) have to hold:

In the perturbed motion of a rocket, taking into account the elastic oscillations of its airframe as a straight flexible nonuniform rod:

the "stable" eigenvalues belong to the domain bounded by Cissoid of Diocles

Non-standard notions of "stability"

Not only that the system needs to be c-stabil, but, additional constraints that depend the imaginary parts of eigenvalues (frequency of the oscillations of the basic solutions) have to hold:

In the perturbed motion of a rocket, taking into account the elastic oscillations of its airframe as a straight flexible nonuniform rod:

the "stable" eigenvalues belong to the domain bounded by Cissoid of Diocles

Another damped stability domain that occurs in practice is a wedge around real axis: the "stable" eigenvalues have complex arguments between $\pi - \theta$ and $\pi + \theta$

Frequency band of the undesirable noise

In structural acoustics, the localization of the eigenvalues in the complex plane corresponds to the appearance of acoustic waves of certain frequencies. In practice, certain frequency bands of the noise are of special interest.

Having this in mind, our goal is to

- 1. develop techniques to investigate position of eigenvalues without computing them,
- 2. take into account perturabtions,
- 3. construct efficient computational techniques for practical use.

Therefore, we are interested in:

- domains of the "stability" in its general setting,
- behaviour of the eigenvalue localization sets under perturbations,
- computational costs for obtaining spectral and pseudospecral lozalizations and corresponding bounds.

Definition (point-wise form)

Given arbitrary $A \in \mathbb{C}^{n,n}$ its comparison matrix is $\langle A \rangle = [\alpha_{kj}]$:

$$\langle A \rangle = [\alpha_{kj}] \in \mathbb{R}^{n,n}, \quad \alpha_{kj} = \begin{cases} |a_{kk}|, & k = j \\ -|a_{kj}|, & k \neq j \end{cases}$$

Definition (block comparison matrix)

Given arbitrary $A \in \mathbb{C}^{n,n}$, by $\pi = \{n_j\}_{j=0}^{\ell}$, where nonnegative numbers $n_j, j = 1, 2, \ldots, \ell$, satisfy $n_0 := 0 < n_1 < n_2 < \cdots < n_{\ell} := n$, we denote a *partition* of the index set N.

For arbitrary *p*-norm, we define the block comparison matrix of $n \times n$ matrix *A* partitioned into $\ell \times \ell$ blocks by :

$$\left(\langle A \rangle_{\pi}^{(p)}\right)_{kj} := \begin{cases} \|A_{kk}^{-1}\|_p^{-1} & \text{if } k = j\\ -\|A_{kj}\|_p & \text{if } k \neq j, \end{cases}$$

Definition

A complex matrix $A \in \mathbb{C}^{n,n}$ is called (block) (nonsingular) *H*-matrix iff its (block) comparison matrix $(\langle A \rangle_{\pi}^{(p)}) \langle A \rangle$ is a (nonsingular) *M*-matrix.

Definition

A complex matrix $A \in \mathbb{C}^{n,n}$ is called (block) (nonsingular) *H*-matrix iff its (block) comparison matrix $(\langle A \rangle_{\pi}^{(p)}) \langle A \rangle$ is a (nonsingular) *M*-matrix.

So, in point-wise case, this means:

- $\langle A \rangle$ is nonsingular and $\langle A \rangle^{-1}$ is nonegative *(inverse monotone)*,
- there exist a vector w > 0 such that $\langle A \rangle w > 0$ (positive vector),
- $\langle A \rangle$ can be represented as $\langle A \rangle = sI B$, where $B \ge 0$ and $s > \rho(B)$ (spectral radius),
- the left-most eigenvalue of the matrix $\langle A \rangle$ is positive (*Perron-Frobenious*),

ON GERŠGORIN-TYPE SPECTRAL LOCALIZATIONS

Vladimir R. Kostić (Uni. of Novi Sad)

20.10.2019 25 / 55

Geršgorin's Circles...

Given an arbitrary matrix $A = [a_{ij}] \in \mathbb{C}^{n,n}$, its *i-th Geršgorin's disk* is defined by

$$\Gamma_i(A) := \{ z \in \mathbb{C} : |z - a_{ii}| \le r_i(A) := \sum_{j \ne i} |a_{ij}| \}, \ i = 1, \dots, n$$

and the union of all these disks, denoted by

$$\Gamma(A) := \bigcup_{i=1}^n \Gamma_i(A),$$

is called the *Geršgorin's set* of matrix A.

イロト 不得下 イヨト イヨト 二日

Geršgorin's Circles...

Given an arbitrary matrix $A = [a_{ij}] \in \mathbb{C}^{n,n}$, its *i-th Geršgorin's disk* is defined by

$$\Gamma_i(A) := \{ z \in \mathbb{C} : |z - a_{ii}| \le r_i(A) := \sum_{j \ne i} |a_{ij}| \}, i = 1, ..., n$$

and the union of all these disks, denoted by

$$\Gamma(A) := \bigcup_{i=1}^n \Gamma_i(A),$$

is called the *Geršgorin's set* of matrix A.

A well-known result of Geršgorin (1931) states that $\Gamma(A)$ contains the spectrum $\sigma(A)$ of matrix A, i.e.

$$\Lambda(A) \subseteq \Gamma(A).$$

Geršgorin's set & SDD matrices

Geršgorin's set is closely related to the class of complex matrices called strictly diagonally dominant (SDD) matrices, defined by the condition

$$|a_{ii}| > r_i(A) := \sum_{j \in \mathcal{N} \setminus \{i\}} |a_{ij}|, ext{ for all } i \in \mathcal{N} := \{1, 2, \dots, n\}.$$

イロト イポト イヨト イヨト

Geršgorin's set & SDD matrices

Geršgorin's set is closely related to the class of complex matrices called strictly diagonally dominant (SDD) matrices, defined by the condition

$$|a_{ii}| > r_i(A) := \sum_{j \in \mathsf{N} \setminus \{i\}} |a_{ij}|, ext{ for all } i \in \mathsf{N} := \{1, 2, \dots, n\}.$$

Theorem (Varga R.: *Geršgorin and His Circles*, Springer, 2004) The following two statements are equivalent:

- Gerğorin theorem holds true, i.e., for all $A \in \mathbb{C}^{n,n}$, $\Lambda(A) \subseteq \Gamma(A)$.
- Every SDD matrix is nonsingular, i.e., if for all $i \in N |a_{ii}| > r_i(A)$, then $det(A) \neq 0$.

SDD & GDD matrices

Many generalizations of the SDD class have been constructed and used to obtain usefull nonsingularity results and/or localizations of eigevalues:

- doubly SDD (Brauer's ovals of Cassini),
- cycle SDD (Brualdi lemniscate sets),
- S-SDD (CKV sets),
- Ostrowski 1&2 SDD (Ostrowski's sets)
- ...
- GDD (Minimal Geršgorin set)

- Compactness principle
- Isolation Principle,
- Inertia & Radius Principles

Geršgorin-type spectral localizations

Definition

Let $\mathbb K$ be a nonempty class of square matrices of an arbitrary size. If $\mathbb K$ is such that:

- for any $A \in \mathbb{K}$, diagonal entries of A are nonzero,
- for every $A \in \mathbb{K}$ and every $B \in \mathbb{C}^{n,n}$, if $\langle B \rangle \ge \langle A \rangle$, then $B \in \mathbb{K}$,

then we say that $\mathbb K$ is a diagonally dominant-type, or briefly DD-type, class of matrices.

Here, $\langle A \rangle := [m_{ij}] \in \mathbb{R}^{n,n}$ defined by

$$m_{ij} := \left\{ egin{array}{cc} |a_{ii}|, & i=j, \ -|a_{ij}|, & ext{otherwise.} \end{array}
ight.$$

イロト イポト イヨト イヨト

denotes the comparison matrix of the matrix A.

Vladimir R. Kostić (Uni. of Novi Sad)

Geršgorin-type spectral localizations

Theorem (Equivalence Principle)

Given a class of square complex matrices of an arbitrary size, denoted by \mathbb{K} , for an arbitrary square matrix A, define the set of complex numbers

$$\Theta^{\mathbb{K}}(A) := \{z \in \mathbb{C} : A - zI \notin \mathbb{K}\}.$$

Then, the following two conditions are equivalent:

- All matrices from K are nonsingular;
- Given an arbitrary square matrix A, the set Θ^K(A) contains all its eigenvalues, i.e., Λ(A) ⊆ Θ^K(A).

When $\mathbb K$ is a DD-type, the mappping $\Theta^{\mathbb K}$ we name as the Geršgorin-type spectral localization.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >
Principles of Geršgorin-type spectral localizations

Theorem (Monotonicity Principle)

The mapping $\Theta^{\mathbb{K}}$ is monotone in \mathbb{K} , i.e. if $\mathbb{K}_1 \subseteq \mathbb{K}_2$, then, for an arbitrary square matrix A, $\Theta^{\mathbb{K}_2}(A) \subseteq \Theta^{\mathbb{K}_1}(A)$ holds.

Theorem (Isolation Principle)

Given a nonsingular DD-type class of matrices \mathbb{K} and arbitrary matrix $A \in \mathbb{C}^{n,n}$, $n \geq 2$, if there exist closed disjoint sets $U, V \subseteq \mathbb{C}$ such that for the corresponding Geršgorin-type set $\Theta^{\mathbb{K}}(A)$

$$\Theta^{\mathbb{K}}(A) = U \cup V,$$

then, the number of eigenvalues and the number of diagonal entries of the matrix A in the set U coincide.

Principles of Geršgorin-type spectral localizations

For a given class of matrices $\ensuremath{\mathbb{K}}$ we say that it is:

- star-shaped, if for every real $\alpha > 0$, $A \in \mathbb{K}$ implies $\alpha A \in \mathbb{K}$.
- open, if for every matrix A ∈ K, there exists an arbitrary small ε > 0, such that for every matrix B ∈ C^{n,n}, |(A − B)_{ij}| < ε, for all i, j ∈ N, implies B ∈ K.
- **SDD-type** class if it is nonempty open star-shaped DD-type class of matrices.

Theorem (Compactness Principle)

Given a nonsingular SDD-type class of matrices \mathbb{K} and an arbitrary matrix $A \in \mathbb{C}^{n,n}$, the corresponding Geršgorin-type set $\Theta^{\mathbb{K}}(A)$ is a compact set in complex plane.

(日) (同) (日) (日)

Principles of Geršgorin-type spectral localizations

Let d_+ and d_- denote the number of diagonal entries of A which have positive real part and negative real part, respectively, and denote $\langle A \rangle_{re} := [m_{ij}] \in \mathbb{R}^{n,n}$ defined by

$$m_{ij} := \left\{ egin{array}{cc} |\mathrm{Re}\left(a_{ii}
ight)|, & i=j, \ -|a_{ij}|, & \mathrm{otherwise.} \end{array}
ight.$$

Theorem (Inertiia Principle - real case)

Given a nonsingular SDD-type class \mathbb{K} , an arbitrary real matrix $A \in \mathbb{R}^{n,n}$, $n \ge 2$, and the corresponding Geršgorin-type set $\Theta^{\mathbb{K}}(A)$, Then, $\langle A \rangle \in \mathbb{K}$ implies $\Theta^{\mathbb{K}}(A) \cap i\mathbb{R} = \emptyset$, and, consequently, in $(A) = (d_+, 0, d_-)$.

Theorem (Inertiia Principle - complex case)

Given a nonsingular SDD-type class \mathbb{K} , an arbitrary complex matrix $A \in \mathbb{C}^{n,n}$, $n \geq 2$, and the corresponding Geršgorin-type set $\Theta^{\mathbb{K}}(A)$, Then, $\langle A \rangle_{re} \in \mathbb{K}$ if and only if $\Theta^{\mathbb{K}}(A) \cap i\mathbb{R} = \emptyset$, and, consequently, $in(A) = (d_+, 0, d_-)$.

э

Generalization to Nonlinear Eigenvalue problems

K. V., Gardašević D.,: On Geršgor-type Localizations for Nonlinear Eigenvalue Problems, Applied Mathematics and Computation 337, 179-189, 2018

Time delay is 3×3 nonlinear eigenvalue problem from time delay system. The characteristic function $T_{td} \in \mathcal{N}_3(\mathbb{C})$ of a time delay system with a single delay and constant coefficients is $T_{td}(z) = -3zI + A + e^{-z}B$, where:

Pseudospectra localization principle

Definition (via resolvent)

Given arbitrary $A \in \mathbb{C}^{n,n}$ and $\varepsilon > 0$

$$\Lambda_{\varepsilon}(A) = \{z \in \mathbb{C} : \|(A - zI)^{-1}\|^{-1} \leq \varepsilon\}.$$

Lemma (Localization Principle)

Given $s: \mathbb{C}^{n,n} \to \mathbb{R}$ such that for an arbitrary matrix A

$$||A^{-1}||^{-1} \ge s(A)$$

holds true, then

$$\Lambda_{\varepsilon}(A) \subseteq \Theta^{s}_{\varepsilon}(A) := \{z \in \mathbb{C} : s(A - zI) \leq \varepsilon\}.$$

Obviously, different bounds (s) give rise to different ε -pseudospectra localization sets. In the following we derive several, generally different, lower bounds for $||A^{-1}||^{-1}$, and construct the corresponding ε -pseudospectra localizations.

20.10.2019

37 / 55

ε -pseudo Geršgorin sets

This bound is applicable to all matrices, but it is closely related to SDD matrices.

Lemma

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$,

$$||A^{-1}||_{\infty}^{-1} \ge s_{\infty}(A) := \min_{i \in N} (|a_{ii}| - r_i(A))$$

holds true.

Theorem (ε -pseudo Geršgorin sets) For an arbitrary matrix $A \in \mathbb{C}^{n,n}$,

$$\Lambda^{(\infty)}_{\varepsilon}(A)\subseteq \Gamma_{\varepsilon}(A):=\bigcup_{i\in N}\left\{z\in \mathbb{C}\,:\, |a_{ii}-z|\leq r_i(A)+\varepsilon
ight\}.$$

ε -pseudo Geršgorin sets

On the other hand, in case of 2-norm we have that

Lemma

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$,

$$\|A^{-1}\|_2^{-1} \ge s_2(A) := \min_{i \in N} \left\{ |a_{ii}| - \frac{r_i(A) + r_i(A^T)}{2} \right\}$$

holds true.

Theorem (ε -pseudo Geršgorin sets)

For an arbitrary matrix $A \in \mathbb{C}^{n,n}$,

$$\Lambda^{(2)}_arepsilon(\mathcal{A})\subseteq \Gamma^{(2)}_arepsilon(\mathcal{A}):=igcup_{i\in \mathcal{N}}\left\{z\in\mathbb{C}\,:\,|a_{ii}-z|\leq rac{r_i(\mathcal{A})+r_i(\mathcal{A}^T)}{2}+arepsilon
ight\}.$$

Vladimir R. Kostić (Uni. of Novi Sad)

ε -pseudo Brauer set

This bound is closely related to *doubly strictly diagonally dominant (dSDD)* matrices.

Lemma

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$,

$$\|A^{-1}\|_{\infty}^{-1} \geq \min_{i \neq j: |a_{ii}| + r_j(A) \neq 0} \frac{|a_{ii}| |a_{jj}| - r_i(A)r_j(A)}{|a_{ii}| + r_j(A)}$$

holds true, where the minimum over an empty set is defined to be zero.

Theorem (ε -pseudo Brauer set)

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$, the set

$$\mathcal{B}_{\varepsilon}(A) := \bigcup_{i \neq j} \left\{ z \in \mathbb{C} \ : \ |a_{ii} - z| (|a_{jj} - z| - \varepsilon) \le r_j(A) (r_i(A) + \varepsilon) \right\}$$

localizes the ε -psudospectrum of matrix A, i.e., $\Lambda_{\varepsilon}^{(\infty)}(A) \subseteq \mathcal{B}_{\varepsilon}(A)$.

$\varepsilon\text{-pseudo}\ \mathrm{CKV}\ \mathrm{set}$

Another interesting result of this kind can be obtained in connection with S-SDD matrices.

To simplify notation, let $T := \{(i,j) \in S \times \overline{S} : |a_{ii}| > r_i^S(A) \text{ and } |a_{jj}| > r_j^{\overline{S}}(A)\},\$ and, for $(i,j) \in T$, define

$$\alpha_{ij}^{S}(A) := \frac{\left(|a_{ii}| - r_{i}^{S}(A)\right) \left(|a_{jj}| - r_{j}^{\overline{S}}(A)\right) - r_{i}^{\overline{S}}(A)r_{j}^{S}(A)}{\max\{|a_{ii}| - r_{i}^{S}(A) + r_{j}^{S}(A), |a_{jj}| - r_{j}^{\overline{S}}(A) + r_{i}^{\overline{S}}(A)\}}$$

Lemma

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$ and an arbitrary set of indices $S \subseteq N$,

$$\|A^{-1}\|_{\infty}^{-1} \geq \min\left\{\min_{i\in S}\left(|a_{ii}|-r_i^{S}(A)\right),\min_{j\in \overline{S}}\left(|a_{jj}|-r_j^{\overline{S}}(A)\right),\min_{(i,j)\in T}\alpha_{ij}^{S}(A)\right\}$$

holds true.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

ε -pseudo CKV set

Theorem (ε -pseudo CKV sets)

Given an arbitrary matrix $A \in \mathbb{C}^{n,n}$ and an arbitrary set of indices $S \subseteq N$, ε -pseudospectrum of A is localized by the set $C_{\varepsilon}(A)$, i.e.

$$\Lambda^{(\infty)}_{\varepsilon}(A)\subseteq \mathcal{C}^{\mathcal{S}}_{\varepsilon}(A):= \mathsf{\Gamma}^{\mathcal{S}}_{\varepsilon}(A)\cup \mathsf{\Gamma}^{\overline{\mathcal{S}}}_{\varepsilon}(A)\cup \mathsf{V}^{\mathcal{S}}_{\varepsilon}(A)\cup \mathsf{V}^{\overline{\mathcal{S}}}_{\varepsilon}(A),$$

where

$$\begin{split} \Gamma^{S}_{\varepsilon}(A) &:= \bigcup_{i \in S} \left\{ z \in \mathbb{C} : |z - a_{ii}| \le r^{S}_{i}(A) + \varepsilon \right\}, \ \ \Gamma^{\overline{S}}_{\varepsilon}(A) &:= \bigcup_{j \in \overline{S}} \left\{ z \in \mathbb{C} : |z - a_{jj}| \le r^{\overline{S}}_{j}(A) + \varepsilon \right\}, \\ \mathsf{V}^{S}_{\varepsilon}(A) &:= \bigcup_{i \in S, j \in \overline{S}} \left\{ z \in \mathbb{C} : (|z - a_{ii}| - r^{S}_{i}(A) - \varepsilon)(|z - a_{jj}| - r^{\overline{S}}_{j}(A)) \le r^{\overline{S}}_{i}(A)(r^{S}_{j}(A) + \varepsilon) \right\}, \\ \mathsf{V}^{\overline{S}}_{\varepsilon}(A) &:= \bigcup_{i \in S, j \in \overline{S}} \left\{ z \in \mathbb{C} : (|z - a_{ii}| - r^{S}_{i}(A))(|z - a_{jj}| - r^{\overline{S}}_{j}(A) - \varepsilon) \le (r^{\overline{S}}_{i}(A) + \varepsilon)r^{S}_{j}(A) \right\}. \end{split}$$

$$M_2 = \left[\begin{array}{cc} F & 10^{-4}ee^T \\ 10^{-1}ee^T & F \end{array} \right],$$

where F is the Frankel matrix of size n = 100 and e vector of all ones.

Using the technique of M-matrices we have

3

Using the technique of M-matrices we have

• derived principles of Geršgorin-type spectral localizations for standard eigenvalue problems,

3

Using the technique of M-matrices we have

- derived principles of Geršgorin-type spectral localizations for standard eigenvalue problems,
- derived principles of Geršgorin-type spectral localizations for nonlinear eigenvalue problems,

3

Using the technique of M-matrices we have

- derived principles of Geršgorin-type spectral localizations for standard eigenvalue problems,
- derived principles of Geršgorin-type spectral localizations for nonlinear eigenvalue problems,
- developed algorithms for effcient computation of the minimal Geršgorin set,

Using the technique of M-matrices we have

- derived principles of Geršgorin-type spectral localizations for standard eigenvalue problems,
- derived principles of Geršgorin-type spectral localizations for nonlinear eigenvalue problems,
- developed algorithms for effcient computation of the minimal Geršgorin set,
- developed various Geršgorin-type pseudospectral localizations (pointwise and block),

Using the technique of M-matrices we have
